

26 Days in AkiraChix

My name is Mercy Mwikali, an engineer in training at Akirachix..

The past 26 days in AkiraChix have transformed. As of now I do have an understanding of some of the things engineers do and use to create things such as apps.

I have learned most of this things through the different classes i have attended, which include;

1. Front end Web

This class has helped me familiarise with tools such as html and css. In such a way that I am able to create and host a small website.

2. Front end Mobile

In Kotlin I am able to perform different arithmetic functions and every differeate one type of data to another.

3. Backed

I would say I can work well in the Git terminal managing to navigate well between both the git terminal and the python terminal. I also can perform different Arithmetic functions on the python terminal.

4. UX Research

This unit has opened my eyes to how someone is always on the other side of tech making sure that the rest have a good user experience when using mobile applications and even web applications.

5. Ux design

Who knew drawing also has rules of its own especially when it's no longer a drawing but a design. The colors, the different patterns in a design should follow specific principals.

6. Navigating your journey

This class made me realize that there is a possibility of introducing myself in more than a minute. That there is a lot to say about myself, not only my name and age.

7. Quality assurance

Products are not just made by engineers, there are other people including such as the quality assurance team which make sure that the product is of quality before it hits the market.

8. Product management

As a product manager you need to know if not everything on how to build a product from zero, then you should know how to develop the product . you

should also be able to research on what problems there are and that need solutions
